EPA Publishes Lab Compendium

EPA has established an online database that can be used as a starting point to locate available laboratory support in a searchable, easy-to-use database. The Compendium of Environmental Testing Laboratories allows users to search for lab capabilities using standard drop-down controls based on a large number of search criteria, from lab location to monitoring capabilities and additional lab support services. Laboratories with capabilities for analyzing anything from general water quality parameters to chemical warfare agents are included in the database. Utility users must register on the site and receive an email confirmation before receiving password access. The website address is http://www.epa.gov/compendium .
